A neutron star is the collapsed core of a giant star which before collapse had a total of between 10 and 29 solar masses. Neutron stars are the smallest and densest stars, not counting hypothetical quark stars and strange stars. Neutron stars have a radius of the order of 10 kilometres (6.2 mi) and a mass lower than a 2.16 solar masses. They result from the supernova explosion of a massive star ...

Isospin is regarded as a symmetry of the strong interaction under the action of the Lie group  $SU(2)$ , the two states being the up flavour and down flavour. In quantum mechanics, when a Hamiltonian has a symmetry, that symmetry manifests itself through a set of states that have the same energy (the states are described as being degenerate). In simple terms, that the energy operator for the strong ...

The seeds of a revolution are invariably sown decades before it erupts. And so it is with the revolution in noncoding (nc)RNAs. The principal RNA participants in gene expression, the ribosomal RNAs (rRNAs) and transfer RNAs (tRNAs), were discovered in the 1950s and their central roles as scions of protein synthesis firmly established.
