Abstract. Introduction: Analysis and classifying distal femur fractures is one of the important steps for an orthopaedic surgeon towards a successful outcome in treating these fractures. Few surgeons tried to classify these fractures and we discuss in detail those systems and their clinical relevance . Three classification systems have been discussed below and it has shown the Müller AO ...

The Gustilo open fracture classification system is the most commonly used classification system for open fractures. It was created by Ramón Gustilo and Anderson, and then further expanded by Gustilo, Mendoza, and Williams. This system uses the amount of energy, the extent of soft-tissue injury and the extent of contamination for determination of fracture severity. Progression from grade 1 to ...

A femoral fracture is a bone fracture that involves the femur. They are typically sustained in high-impact trauma, such as car crashes, due to the large amount of force needed to break the bone. Fractures of the diaphysis, or middle of the femur, are managed differently from those at the head, neck, and trochanter (see hip fractures

Introduction. Distal radius fractures are the most frequent lesions encountered during clinical practice.<sup>34, 43</sup> Therefore, the treatment is controversial and still debated in the literature. Despite the improvements made in both the diagnosis and the management of these injuries, long term pain, stiffness and impairment of strength of the affected joint are not uncommon. 32 These sequelae may ...

Fractures are mechanical breaks in rocks involving discontinuities in displacement across surfaces or narrow zones. Fracture is a term used for all types of generic discontinuities. This usage is common among scientists inside and outside the earth sciences and is used in other chapters of this report.
