Drug design, often referred to as rational drug design or simply rational design, is the inventive process of finding new medications based on the knowledge of a biological target. The drug is most commonly an organic small molecule that activates or inhibits the function of a biomolecule such as a protein, which in turn results in a therapeutic benefit to the patient.

The life sciences or biological sciences comprise the branches of science that involve the scientific study of life and organisms – such as microorganisms, plants, and animals including human beings.. Life science is one of the two major branches of natural science, the other being physical science, which is concerned with non-living matter.. By definition, biology is the natural science ...

Abstract. Daylight vision begins when light activates cone photoreceptors in the retina, creating spatial patterns of neural activity. These cone signals are then combined and processed in downstream neural circuits, ultimately producing visual perception.

Cross-Cutting Themes Throughout the strategic planning process, a number of cross-cutting themes emerged that are relevant across multiple goals and objectives. NIDA will work to ensure that these themes are addressed across institute programs and initiatives. These cross-cutting elements include:

150. Joint Bayesian inference of risk variants and tissue-specific epigenomic enrichments across multiple complex human diseases (Li, Kellis). Genome wide association studies (GWAS) provide a powerful approach for uncovering disease-associated variants in human, but fine-mapping the causal variants remains a challenge.
