Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

## Glossary of research economics - econterms

Conditional budgeting is a budgeting approach designed for companies with fluctuating income, high fixed costs, or income depending on sunk costs, as well as NPOs and NGOs. The approach builds on the strengths of proven budgeting approaches, leverages the respective advantages for situations of fluctuating incomes, and at the same time reduces possible negative

impacts.

The Monty Hall problem is a brain teaser, in the form of a probability puzzle, loosely based on the American television game show Let's Make a Deal and named after its original host, Monty Hall. The problem was originally posed (and solved) in a letter by Steve Selvin to the American Statistician in 1975 (Selvin 1975a), (Selvin 1975b). It became famous as a question from a reader's letter quoted ...

$A^i_j = P(T_{t=1} | Z_t = s_i) \wedge T_{t=1} = s_j | P(T_{t=1} | Z_t = s_i)$  This formula encodes a simple intuition: the maximum likelihood probability of transitioning from state  $i$  to state  $j$  is just the number of times we transition

referred to as the alphabet of  $X$ . The probability that  $X$  takes on the particular value  $x$  is written  $\Pr(X = x)$ , or just  $\Pr(x)$ . We may also form joint and conditional probabilities.

Question 1137054: If a procedure meets all the conditions of a binomial distribution except that the number of trials is not fixed, then the geometric distribution can be used. The probability of getting the first success on the  $x$ th trial is given by  $P = p^{x-1}$ , where  $p$  is the probability of success on any one trial.
