Graphene is a crystalline allotrope of carbon with 2-dimensional properties. Its carbon atoms are packed densely in a regular atomic-scale chicken wire pattern.. Each atom has four bonds: one σ bond with each of its three neighbors and one π -bond that is oriented out of plane. The atoms are about 1.42 Å apart.. Graphene's hexagonal lattice can be regarded as two interleaving triangular ...

16.1 Introduction. 16.2 Stress-Strain Behavior. The description of stress-strain behavior is similar to that of metals, but a very important consideration for polymers is that the mechanical properties depend on the strain rate, temperature, and environmental conditions.. The stress-strain behavior can be brittle, plastic and highly elastic (elastomeric or rubber-like), see Fig. 16.

Remember these rules: When functions are transformed on the outside of the $f(x)$ part, you move the function up and down and do "regular" math, as we'll see in the examples below. These are vertical transformations or translations.. When transformations are made on the inside of the $f(x)$ part, you move the function back and forth (but do the opposite math - basically since if you ...
